We believe that the best way to grasp and internalize the fundamental concepts in signal processing is through the geometry of Hilbert spaces, as this leverages the great innate human capacity for spatial reasoning. While using geometry should ultimately simplify the subject, the connection between signals and geometry is not innate.

Together with Fourier and Wavelet Signal Processing (to be published by CUP), the two books aim to present the essential principles in signal processing along with mathematical tools and algorithms for signal representation. They comprehensively cover both classical Fourier techniques and newer basis constructions from filter banks and multiresolution analysis—wavelets.

Articles about foundations aren't typically as full of barbs as Marc Gunther's long piece on the Silicon Valley Community Foundation (SVCF) in the most recent edition of the Stanford Social Innovation Review. That makes it an entertaining read, but the underlying debate — about the role of community foundations — makes it an important one.
