Internal combustion engines Camshaft. In four-stroke cycle engines and some two-stroke cycle engines, the valve timing is controlled by the camshaft. It can be varied by modifying the camshaft, or it can be varied during engine operation by variable valve timing. It is also affected by the adjustment of the valve mechanism, and particularly by the tappet clearance.

1. When the engine has started, the RPM should be 900-1000 RPM when idling. 2. Check the oil pressure. Normally this should be 2-4.5 bar. With cold engine the RPM should be kept down so that the oil pressure does not exceed 4.5 bar. When idling at warm engine the oil pressure must not be below 1 bar. 3.
