Remark 2.1. We will refer to the triple  $(\Omega, \mathcal{F}, \mu)$  as a measure space. If  $\mu(\Omega) = 1$  we refer to it as a probability space and often write this as  $(\Omega, \mathcal{F}, P)$ . Example 2.1. Let  $\Omega$  be a countable set and let  $\mathcal{F} =$  collection of all subsets of  $\Omega$ . Denote by  $\#A$  denote the number of point in  $A$ . Define  $\mu(A) = \#A$ . This is called the counting measure.

1.3 An example of using probability theory Probability theory deals with random events and their probabilities. A classical example of a random event is a coin tossing. The outcome of each tossing may be heads or tails: Hor T. If the coin is fair then after Ntrials, Hoccurs approximately N/2 times, and so does T.Itisnaturaltobelieve that if N ...

Measure Theory and Probability. The entire point of Probability is to measure something. Unlike length and weight we have very specific values we care about, namely the interval.  $[0, 1]$   $[0, 1]$   $[0, 1]$ . The most basic point of probability is that you are measuring the likelihood of events on a scale from 0 to 1.

Measure Theory together with  $X$  from an additive system on which  $\mu(X) = 2$ . A non-negative, completely additive function $\mu$ defined on a Borel system  $S$  of subsets of a set  $X$  is called a measure. It is bounded (or finite) if  $\mu(X) < \infty$ . It is called a probability measure if  $\mu(X) = 1$ .
